About the Scan

The Institute for Global Tobacco Control (IGTC) offers the Policy Scan Project as a resource for researchers, policymakers, and practitioners in the field of tobacco control. Our scans offer information on rapidly evolving regulatory approaches for emerging tobacco and nicotine products. The Policy Scan started in 2014 providing information on e-cigarette regulations in 68 countries. Since that time the Policy Scan has expanded to more countries, captured information on additional tobacco and nicotine products, and continues to be updated to provide the most accurate information possible.

Each of our policy scans contains webpages for the 194 member states recognized by the World Health Organization (WHO). We also include information on other jurisdictions, such as territories or autonomous regions. These other jurisdictions are added to our site when we receive information on tobacco control regulations specific to these jurisdictions. Currently we include information in our policy scan for the following jurisdictions: England, Greenland, Guam, Northern Ireland, Scotland, and Wales. We add regulatory information to our policy scans as available and update them when new information is obtained. Each page contains text to indicate when the page was last updated. We also have semi-annual updates of all scans where we reach out to existing contacts to obtain information on any regulatory changes. These regularly scheduled updates occur each Fall (October/November) and Spring (March/April). To access these scans, click on the “Policy Scan” tab at the top of the website and use the dropdown menu to select the scan of interest.

[E-Cigarette Policy Scan](#)

Our inaugural policy scan sought to fill a gap in general understanding of how countries were regulating e-cigarettes –including the regulatory mechanisms used and the regulatory domains being applied. Through conducting this scan of regulatory approaches, we identified 68 countries regulating e-cigarettes and found that many of these countries were regulating these products using legislation that pre-dated the advent of e-cigarettes in their respective markets. Since our first scan of e-cigarette regulations, significant global legislative action has occurred to directly address this emerging tobacco product, which our policy scan will continue to track and report.

[HTP Policy Scan](#)

Heated tobacco products (HTPs) were our first expansion to a different tobacco product. HTPs heat tobacco to create a vapor that users inhale, and sometimes use electronic devices as heating elements. While similar in some ways to e-cigarettes, HTPs are a distinct class of tobacco products, with many countries using different regulatory frameworks to oversee the importation, marketing, sale, and other aspects of these products. Our HTP policy scan first launched in 2020 and continues to expand to additional countries and incorporating more complete information for each country included in the scan.
